Fuel Without Borders

PlusOneThree

The Tension

Why does an Indian marathoner running 42kms in 32°C heat and 85% humidity have to fuel like a hospital patient? Athletes training for Ironman 70.3 Goa, HYROX, and 100km brevets do not lack discipline; they face a punishing nutritional squeeze. The imported gold standards—Maurten and Science in Sport—cost ₹350 to ₹500 per sachet on grey-market sites or require Dubai suitcase mules, while domestic ₹65–₹80 gels trigger violent sweetness nausea and GI distress under tropical heat. As runner Nikhil Shembekar noted, domestic gels cause severe stomach issues right before peak long runs, echoing David Dack's observation that stomachs reject arbitrary rankings. When commercial gym hydration fails to replenish massive sweat rates, runners lock up from sodium crashes, as Vedant Kunte experienced at the Tata Mumbai Marathon. Endurance athletes survive on kitchen and chemist hacks: ₹25 medical ORS, bananas, five salt capsules across 104km rides, or race-station bella-uppu.

The Reframe

Endurance fuel cannot be sold as an aesthetic lifestyle flex. While creator vernacular pitches that carbs are sexy AF and addresses how Zone 2 pace collapses in heat, serious athletes do not treat 30km fuelling as gym-bro lifestyle content. The community's immediate response under launch posts is economic anxiety, pleading not to make it costly and unaffordable. With 8,500+ waitlist signups driven primarily through co-founder Anmol Raina's 455k followers, the product faces immediate dismissal as influencer merch by distance runners, triathletes, and brevet cyclists who distrust gym nutrition. The 90% whey-and-creatine market has conditioned them to expect sugar syrups that fail past kilometer 25. The brand cannot win as creator merchandise; it must establish itself as essential sports science.

From an influencer-backed creator supplement promising "sexy carbs" to Anmol's personal following → to the uncompromising, protocol-driven Indian endurance standard engineered for tropical sweat rates and sustained hour-four output.

Fuel Without Borders

Fuel Without Borders strips away creator posturing and subjects PlusOneThree to The Field Audit: brutal, unscripted race-condition field tests across India's core endurance corridors. Endurance efforts are effortless in Hour One; the collapse happens in Hour Four, when domestic sugar syrups trigger nausea, medical ORS exhausts its carbohydrate payload, and 85% humidity bleeds the body of sodium. PlusOneThree enters not as lifestyle merchandise, but as an uncompromising clinical ratio: 45g dual-source carbohydrates (1:0.8 maltodextrin-to-fructose) paired with 1,000mg electrolytes, anchored by 600mg sodium built specifically for tropical sweat rates. Timed for peak race training season in October and November 2026—spanning Vedanta Delhi Half Marathon prep, Ironman 70.3 Goa training blocks, and Tata Mumbai Marathon 30k simulations—The Field Audit takes the formulation out of controlled creator studios and onto the tarmac. It proves that world-class endurance fuelling no longer requires international grey markets or suitcase imports from Dubai.

The Spine

The campaign executes across a strict fortnight on either side of launch, shifting the narrative from DIY survival hacks to locked race-day protocols across four phases:

- Phase 1: The Chemist Hack Audit (Launch -14 Days to -1 Day): Exposes the dangerous nutritional compromises Indian distance athletes make, dismantles the ₹25 hospital ORS myth, and validates the 8,500 waitlist signups outside Anmol's immediate network.
- Phase 2: The Spec Drop & Waitlist Wave (T-0 to T+3 Days): Unveils the dual SKU architecture—Stim and Non-Stim—activates the 13% launch code, and demonstrates clinical ingredient math directly through co-founder Ishan Shrivastava.
- Phase 3: The Hour Four Intercept (Launch +4 Days to +10 Days): Physically meets runners between 5:00 AM and 9:00 AM at iconic training grounds in Bengaluru, Mumbai, and Delhi, replacing sticky syrups at kilometer 28.
- Phase 4: Race-Day Protocol Integration (Launch +11 Days to +14 Days): Embeds PlusOneThree into structured 2026/2027 training cycles for Ironman 70.3 Goa, Vedanta Delhi Half Marathon, and Tata Mumbai Marathon.

Content Formats

Repeatable content engines deployed across the four operational buckets:

- Fact-Based Teardown Cards: Visual head-to-head comparisons matching ₹25 medical ORS and bananas against ₹450 imported sachets and PlusOneThree's 45g/600mg formulation.
- Comment-Section Banter: Unfiltered community confessionals cataloguing stomach distress, sweetness nausea, and salt lockups across Indian marathon courses.
- Script vs. Scene Protocol: Side-by-side protocol walkthrough contrasting Hour 1–3 Non-Stim baseline fuelling with the targeted Hour 4 Stim caffeine surge.
- Founder Piece-to-Cam: Unscripted address by Ishan Shrivastava breaking down formulation maths, transparent ingredient sourcing, and fair domestic pricing.
- IRL Long-Run Stunt: Pop-up swap stations at Cubbon Park, NCPA, and Nehru Park trading sticky syrups for PlusOneThree during 25k+ weekend runs.
- Post-Run Vox Pop: Sweat-drenched runners intercepted at kilometer 28 to capture unvarnished live reactions on gut lightness and cramping.
- Template Virality Fuel Planners: Downloadable, printable pacing sheets aligning hourly carbohydrate grams and sodium requirements to athlete bodyweight and race targets.
- Story Reposts of Top Performers: Verified Strava workout telemetry paired with real-time cramp ratings and gut comfort scores from switching athletes.

Distribution Architecture

Content without verified athletic distribution remains a theoretical mood board. Every phase aligns directly with distinct endurance handle archetypes across India:

- The Chemist Hack Audit: Seeded across sub-3 marathon pacers, Super Randonneur ultra-cyclists, and certified Ironman Goa triathletes to spark clinical debate outside Anmol's fitness creator circle.
- The Spec Drop & Waitlist Wave: Coordinated through hybrid fitness coaches, Strava club captains, and HYROX athlete profiles to establish technical authority and protocol validity on launch morning.
- The Hour Four Intercept: Amplified via Bengaluru, Mumbai, and Delhi regional running club captains, amateur collegiate distance runners, and weekend long-run training syndicates filming on-ground tarmac reactions.
- Race-Day Protocol Integration: Distributed directly through accredited endurance sports dietitians, sanctioned marathon coaches, and regional running club administrators managing closed WhatsApp and Telegram training rosters.

This architecture ensures PlusOneThree bypasses generic lifestyle fitness feeds and embeds directly inside the specific training ecosystems of competitive distance athletes.

Proof

The formulation responds directly to verified, documented physical failures across the Indian endurance landscape:

- Formulation Math: Delivers 45g dual-source carbohydrates at a clinical 1:0.8 maltodextrin-to-fructose ratio to unlock simultaneous SGLT1 and GLUT5 intestinal transporter pathways, avoiding the sweetness nausea of ₹65–₹80 domestic syrups.
- Electrolyte Osmolality: Provides 1,000mg total electrolytes with 600mg sodium per serving, directly correcting the massive sweat deficits that caused runner Vedant Kunte's total cramp lockup during the Tata Mumbai Marathon.
- Economic Inefficiency: Resolves the imported elite barrier where runners pay ₹350 to ₹500 per Maurten or Science in Sport packet via Dubai suitcase mules and bootleg grey markets.
- Documented Community Demand: Over 8,500 athletes have actively joined the pre-launch waitlist, proving deep appetite for an uncompromised domestic standard that eliminates reliance on hospital ORS, bananas, and five-capsule salt hacks.

Commitment

WLDD commits exclusively to deliverables grounded in verified campaign scope and named services across the October and November 2026 calendar:

- Influencers: Contracting and briefing 40+ dedicated endurance athletes—including sub-3 marathoners, ultra-cyclists, Ironman competitors, and HYROX coaches—operating strictly outside Anmol's existing network.
- Offline Activity: Executing physical fueling stations across three premier training hubs: Cubbon Park (Bengaluru), Marine Drive/NCPA (Mumbai), and Nehru Park (Delhi) between 5:00 AM and 9:00 AM.
- Production & Amplification: Field crews capturing unscripted long-run footage and Post-Run Vox Pop reels at kilometer 28, amplifying unvarnished athlete feedback across regional running networks.
- ORM: Managing athlete sentiment and answering technical fuelling questions across closed marathon WhatsApp communities, Telegram channels, and Strava clubs.
- Content Creation / Illustration Work: Producing dual-transporter osmolality infographics, Stim versus Non-Stim protocols, and downloadable race calculators to convert 8,500+ waitlist athletes via the 13% launch code.
